

COVID-19 DELTA VARIATION - DID YOU KNOW?

In an indoor space where the ventilation isn't adequate, somebody with the infection could have come and gone, but the virus may still be **lingering in the air.**

This means that if you walk through that area and you breathe that air, **you could get infected.**

Covid particles can linger in the air **for up to 16 hours,** meaning ventilation is vital.

If you are in an office, boardroom, a closed room or in a car, **open the windows.** It's the shared air that matters the most - that means **wear your mask** whenever you are around people.

Sanitising and washing hands is important but the most important element with the Delta Variant **is the air we breathe** making wearing a mask extremely important.
